SwapDesk launch economics

A support agent that arranges exchanges—not just replies. This draft tests a software-only merchant subscription, with synthetic demo operations and no claim of production readiness.

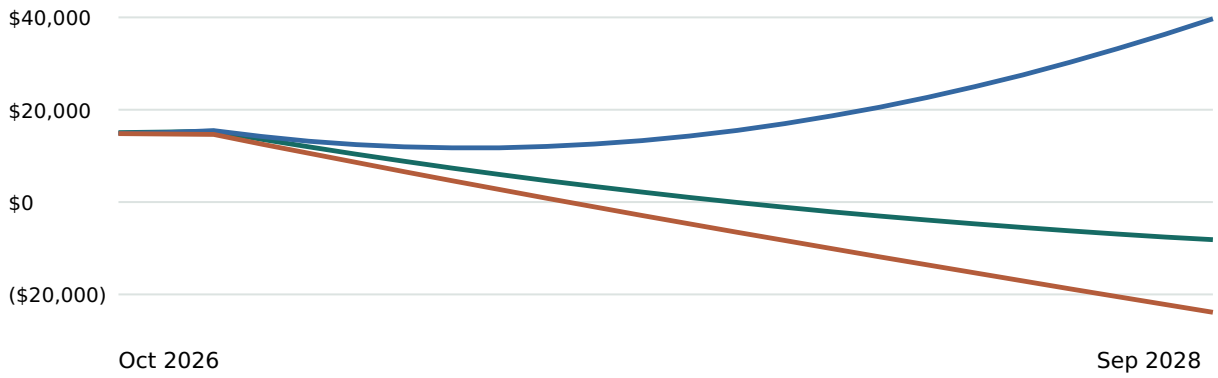
> **Recommendation:** validate paid merchant demand and technical-support workload before optimizing inference pennies. The offer covers modeled variable costs, but Base growth does not yet support the proposed founder pay and overhead.

Proposed commercial offer

$49/store/month includes 100 verified arranged exchanges. $0.50 for each additional verified arrangement. Questions, denials and escalations are not overage-billable; every attempt incurs execution cost. Pricing is an unvalidated hypothesis.

Final month · Sep 2028	Base	Growth	Bad reliability
Revenue	$2,363	$7,715	$1,369
Gross profit	$1,768	$6,110	$678
Operating profit	($588)	$3,341	($1,678)
Ending cash	($8,147)	$39,715	($23,860)
First negative cash month	Nov 2027	None within horizon	Aug 2027
Final gross margin	74.8%	79.2%	49.5%

Cash over the 24-month forecast



Base · teal Growth · blue Bad reliability · orange

October 2026–September 2028. All cases assume $15,000 opening cash. Negative cash is an unmet funding gap; no hypothetical raise is inserted. Growth stays positive within this horizon only under its acquisition assumptions.

Unit economics and the reliability link

Merchant staff handle escalated customer tickets. SwapDesk funds technical support and onboarding. Merchant shipping/refund costs are not our software costs. Managed ticket handling is a different offer and is not priced here.

Base per store / month	Small shop	Growing shop
Cases attempted	120	400
Verified arrangements	78	260
Subscription revenue	$49	$49
Overage revenue	$0	$80
Total revenue	$49	$129
Inference spending	$4.14	$13.80
Variable infrastructure	$1	$1
Technical support	$6.25	$12.50
Recurring contribution	$37.61	$101.70
CAC-only payback months	2.66	0.98

Contribution excludes fixed hosting, onboarding, acquisition, founder pay and other overhead. CAC-only payback is $100 divided by recurring contribution; including $37.50 onboarding increases payback. Rates are assumed constant within segments.

How execution cost is calculated

Attempted cases = ending stores × cases per store. Total executions = attempted cases × (1 + extra execution factor). Inference spending = executions × $0.03. Verified arrangements = attempted cases × resolution rate.

Overage is calculated per segment/store—not from a pooled company allowance. A Small shop at 78 arrangements uses none; a Growing shop at 260 earns 160 × $0.50 = $80.

Scenarios differ in real operating levers

Input	Base	Growth	Bad reliability
New stores · Small / Growing	1 / 0.5	3 / 1.5	1 / 0.5
Churn · Small / Growing	3% / 2%	2% / 1.5%	6% / 5%
Verified arrangement rate	65%	75%	45%
Extra execution factor	15%	10%	60%
Support minutes · Small / Growing	15 / 30	15 / 30	30 / 60
Inference cost per verified arrangement	$0.0531	$0.0440	$0.1067

The stress scenario reduces billable arrangements, raises execution/support costs, and increases merchant churn. It is a hypothetical stress case—not a measured failure rate.

Measurements used cautiously

Reported limited V2 average model costs: arranged $0.0251; clarification $0.0124; denial $0.0121; escalation $0.0102. List-price estimates are not proxy invoices and exclude some failed/repeated calls, infrastructure and human labor. The older benchmark’s performance claims remain provisional.

Editable assumptions and funding basis

Input	Base draft value	Basis / limitation
Opening stores	5 Small / 2 Growing	Hypothetical pilot population; not customers
Monthly acquisitions	1 Small / 0.5 Growing	Expected values; unvalidated demand
Monthly churn	3% Small / 2% Growing	Planning judgment
Cases per store	120 Small / 400 Growing	Illustrative workloads
Verified arrangement rate	65%	Not an observed benchmark success rate
Extra executions per case	15%	Retries separately charged
Inference cost per execution	$0.03	Allowance; limited reported samples
Technical support	15 / 30 minutes per store	Merchant support, not customer ticket handling
Technical labor rate	$25/hour	Estimated cost
Acquisition spending	$100/new store	Excludes onboarding
Onboarding	90 minutes/new store	At $25/hour = $37.50
Hosting/database	$75/month + $1/store	No verified supplier quote
Other overhead	$150/month	Estimated software/admin allowance
Founder compensation	$24,000/year from Jan 2027	Placeholder; taxes/benefits excluded
Opening cash	$15,000	Hypothetical funding, not observed cash
Collection/payment timing	Same month	No working-capital delay
Temporary credits	$0 recurring benefit	Excluded from recurring economics

Why these are a draft, not a budget

No real merchant roster, approved forecast, cash statement or recurring hosting bill has been supplied. Seven opening merchants represent a hypothetical pilot. Fractional merchants are expected-value planning quantities. $2,000/month founder pay starts January 2027 as a modest placeholder, not a compensation commitment.

Collections and costs settle in the same month. No payroll burdens, tax, capex, debt, financing or customer concentration are included. Add these before using the model to fund or operate a real company.

Priority validation

1. Interview merchants and test willingness to pay $49 plus usage.
2. Measure representative arranged, denied, escalated and retried runs—including all failed attempts.
3. Measure onboarding and technical-support hours per merchant.
4. Obtain hosting quotes and confirm opening funding before hiring or paying salaries.

Monthly financial appendix

Rounded for display only. Exact saved model values underlie the calculations. Base assumes 1.5 new stores/month; Growth 4.5; Bad Reliability raises churn and support burden.

Month	Base revenue	Base op. profit	Base cash	Growth cash	Bad-rel. cash
Oct 2026	$604	$39	$15,039	$14,879	$14,843
Nov 2026	$703	$116	$15,155	$15,043	$14,723

Jul 2028	$2,246	($680)	($6,925)	$33,228	($20,493)
Aug 2028	$2,305	($634)	($7,559)	$36,374	($22,182)
Sep 2028	$2,363	($588)	($8,147)	$39,715	($23,860)

Verification and live model

Each scenario’s 24 monthly revenue, gross-profit, operating-profit and cash values reconciled to independent arithmetic. Cash equals the opening assumption plus cumulative net cash flow. A $10 pricing driver test changed revenue/profit/cash while leaving usage, inference and founder payroll unchanged; the temporary test scenario was deleted.

Saved cfo.ai pages: **SwapDesk — Business Plan, Assumptions, Operations, Financials.** Main Scenario is Base; alternatives are Growth and Bad Reliability. The local simulator previews price, arrangement rate and retries while holding customer, churn and support trajectories fixed. Browser rendering passed in light/dark themes; clicks and slider gestures were not browser-tested.

This PDF is a static snapshot. The native model is the editable source. The Excel export omits Canvas and prose, which this business-plan snapshot supplies. No files were committed or published to GitHub by this model build.
